1. INTRODUCTION

1.1 Project Overview:

During the last years, online shopping has been growing. In 2013, the total turnover for ecommerce in Europe expanded with 17% in contrast to the 12 months before and huge organizations can have hundreds and hundreds of products or even more from which we can select on websites. Both the customer and the business enterprise desire the client to easily discover applicable products or items both throughout search and when they are searching, and this is where recommender systems come into the picture. The greater part (62%) of US buyers with Web access presently shop on-line, to some degree, at least a month, and 1% say they do not buy from internet, as indicated by a current report by Walker Sands. From all the clients looking for items on the web, 63% of them buy garments (Burke, 2002), these being, quite possibly, the most purchased items. The information uncover that women are more likely to buy on-line, with 71% of ladies doing this, contrasted with 52% of men. Studies on clothing are in a growing development in general as a result of the tremendous market related to dress. In China, the serviceable market crushed 20 billion US dollars in 2016. Picture recovery can be depicted as The the errand of looking out for pics in a picture data set. This is present not an astute thought, in light of everything. It has been explored on account of the way that the 1970s joined informational collection associations with PC vision, looking into the issue as indicated through two uncommon perspectives, the first being text-based and the second one being visual-based. From the outset, the developments have been made only through information annotations that have been saved in a database to work the retrieval step, however, when the dimension of the image collections started to amplify the effort required to label them used to be as soon as unsustainable, to solve this issue, during the 1990s, content-based photograph retrieval was proposed. Starting now many searched for lines have seemed the use of one or the different isolated or combining them. Recommendation systems make recommendations based on the information they are provided with and in the manner in which they are programmed. Going into details, most of the evaluation applied is independent coming up with a brand-new recommendation algorithm, system, or model. However, different researchers use already existing work as researchers use an already existing current piece of work to come up with a new diagram or to truly improve the current one.

The present analysis model focuses on the use of a current algorithmic program and, consequently, the use of a new research concept comes up with a recommender system. Existing research and fashions have given us some

inspirations of how to design fashion recommendation systems. Nevertheless, they also involve some common drawbacks. Therefore, in this study, our aim to suggest a new method to assist personal choice making through supplying images and get suggestions based on provided contents.

1.2 Purpose:

Recommendation systems are the techniques that are used to predict the rating one individual will give to an item or social entity. The items can include books, movies, restaurants and things on which individuals have different preferences. These preferences are being predicted using two approaches first content-based approach which involves characteristics of an item and second collaborative filtering approaches which considers user's past behavior to evaluate its choices. This thesis proposes a fashion recommendation system which will recommend clothing images supported the style sort of the provided clothing images. In this work, we focus on the images of upper body as well as the lower body clothing and with human model in the images. We have created our own datasets through web scrapping of different ecommerce websites. In this

paper we have come up with an idea to build a content-based recommendation system.

2.LITERATURE SURVEY

2.1 Problem Statement

DESCRIPTION:

Authors :

Wen-Huang Cheng, Sijie Song, Chieh-Yun Chen, Shintami Chusnul Hidayati, Jiaying Liu

Abstract :

Fashion is the way we present ourselves to the world and has become one of the world's largest industries. Fashion, mainly conveyed by vision, has thus attracted much attention from computer vision researchers in recent years. Given the rapid development, this article provides a comprehensive survey of more than 200 major fashion-related works covering four main aspects for enabling intelligent fashion:

- (1) Fashion detection includes landmark detection, fashion parsing, and item retrieval;
- (2) Fashion analysis contains attribute recognition, style learning, and popularity prediction;
- (3) Fashion synthesis involves style transfer, pose transformation, and physical simulation; and
- (4) Fashion recommendation comprises fashion compatibility, outfit

matching, and hairstyle suggestion. For each task, the benchmark datasets and the evaluation protocols are summarized. Furthermore, we highlight promising directions for future research.

A Review of Modern Fashion Recommender Systems

Authors : Yashar Deldjoo, Fatemeh Nazary, Arnau Ramisa,
Julian Mcauley, Giovanni

Pellegrini, Alejandro Bellogin, Tommaso Di Noia

Abstract : The textile and apparel industries have grown tremendously over the last years. Customers no longer have to visit many stores, stand in long queues, or try on garments in dressing rooms as millions of products are now available in online catalogs. However, given the plethora of options available, an effective recommendation system is necessary to properly sort, order, and communicate relevant product material or information to users. Effective fashion RS can have a noticeable impact on billions of customers' shopping experiences and increase sales and revenues on the provider-side. The goal of this survey is to provide a review of recommender systems that operate in the specific vertical domain of garment and fashion products. We have identified the most pressing challenges in fashion RS research and created a taxonomy that categorizes the literature according to the objective they are trying to accomplish (e.g., item or outfit recommendation, size recommendation, explainability, among others) and type of side-information (users, items, context). We have also

identified the most important evaluation goals and perspectives (outfit generation, outfit recommendation, pairing recommendation, and fill-in-the-blank outfit compatibility prediction) and the most commonly used datasets and evaluation metrics.

Recommender Systems Leveraging Multimedia Content

Author : Yashar Deldjoo, Markus Schedl, Paolo Cremonesi, Gabriella Pasi

Abstract : Recommender systems have become a popular and effective means to manage the ever-increasing amount of multimedia content available today and to help users discover interesting new items. Today's recommender systems suggest items of various media types, including audio, text, visual (images), and videos. In fact, scientific research related to the analysis of multimedia content has made possible effective content-based recommender systems capable of suggesting items based on an analysis of the features extracted from the item itself. The aim of this survey is to present a thorough review of the state-of-the-art of recommender systems that leverage multimedia content, by classifying the reviewed papers with respect to their media type, the techniques employed to extract and represent their content features, and the recommendation algorithm. Moreover, for each media type, we discuss various domains in which multimedia content plays a key role in human decision-making and is therefore considered in the recommendation process. Examples of the

identified domains include fashion, tourism, food, media streaming, and e-commerce. Apparel recommendation system evolution: an empirical review.

Authors:

Congying Guan, Shengfeng Qin, Wessie Ling, Guofu Ding

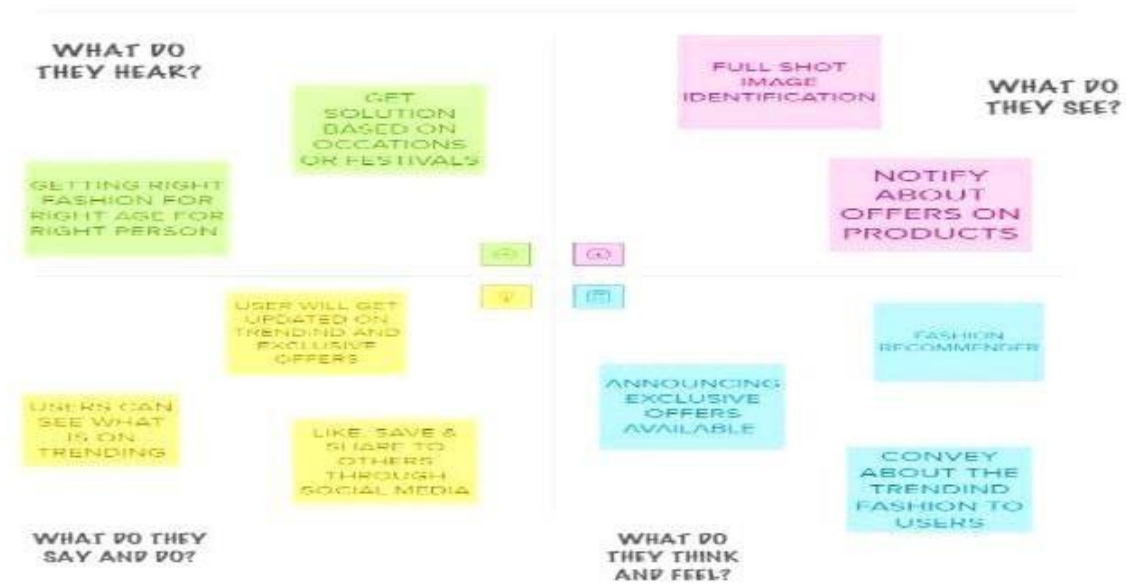

Abstract:

With the developments of e-commerce markets, novel recommendation technologies are becoming an essential part of many online retailers' economic models to help drive online sales. Initially, the purpose of this paper is to undertake an investigation of apparel recommendations in the commercial market in order to verify the research value and significance. Then, this paper reviews apparel recommendation techniques and systems through academic research, aiming to acquaint apparel recommendation context, summarize the pros and cons of various research methods, identify research gaps and eventually propose new research solutions to benefit apparel retailing market.

3. IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas:

EMPATHY MAP

3.2 Ideation:

CUSTOMER CARE REGISTRY

1. Customer Care Registry is an application that has been developed to help the customer in processing their complaints. The customers can raise the ticket with a detailed description of the issue. An Agent will be assigned to the Customer to solve the problem. Whenever the agent is assigned to a customer they will be notified with an email alert. Customers can view the status of the ticket till the service is provided. An online comprehensive Customer Care Solution is to manage customer interaction and complaints with the Service Providers through e-mail. The system should have capability to integrate with any Service Provider from any domain or industry like Banking, Telecom, Insurance, etc. Customer Service may be provided by a Person or Sales & Service Representatives Customer Service is normally an integral part of a company's customer value proposition.

2. Customer Service also known as Client Service is the provision of service to customers its significance varies by product, industry and domain. In many cases customer services is more important if the purchase relates to a service as opposed to a product. Designing the proposed system would enable the faraway customers to render

complain easily and swiftly and the system would help the organization to address the issue of proper documentation and retrieval of their customer's complaints. The customers were classified into two segment that is corporate customers who were 180 and domestic customers who were 460 totalling to 640. Probability random and stratified random sampling techniques were used to select 90 corporate customers and 230 domestic customers for the study sample size.

3. The customer relationship management (CRM) is a set of technological solutions key for efficient business management, the benefits of which, highlighted by previous works, are presented and defined here as crucial for entrepreneurial success. Of particular interest for this purpose are the existing studies on sustainability, which provide a viable research model to assess and validate the potential effect of each CRM component (sales, marketing, and services) on the three dimensions of sustainability (economic, environmental, and social). Service to consumers is very important in increasing the satisfaction of its customers, due to the company customers is the most important asset in which consumers provide its significant in the development of the company's reputation.

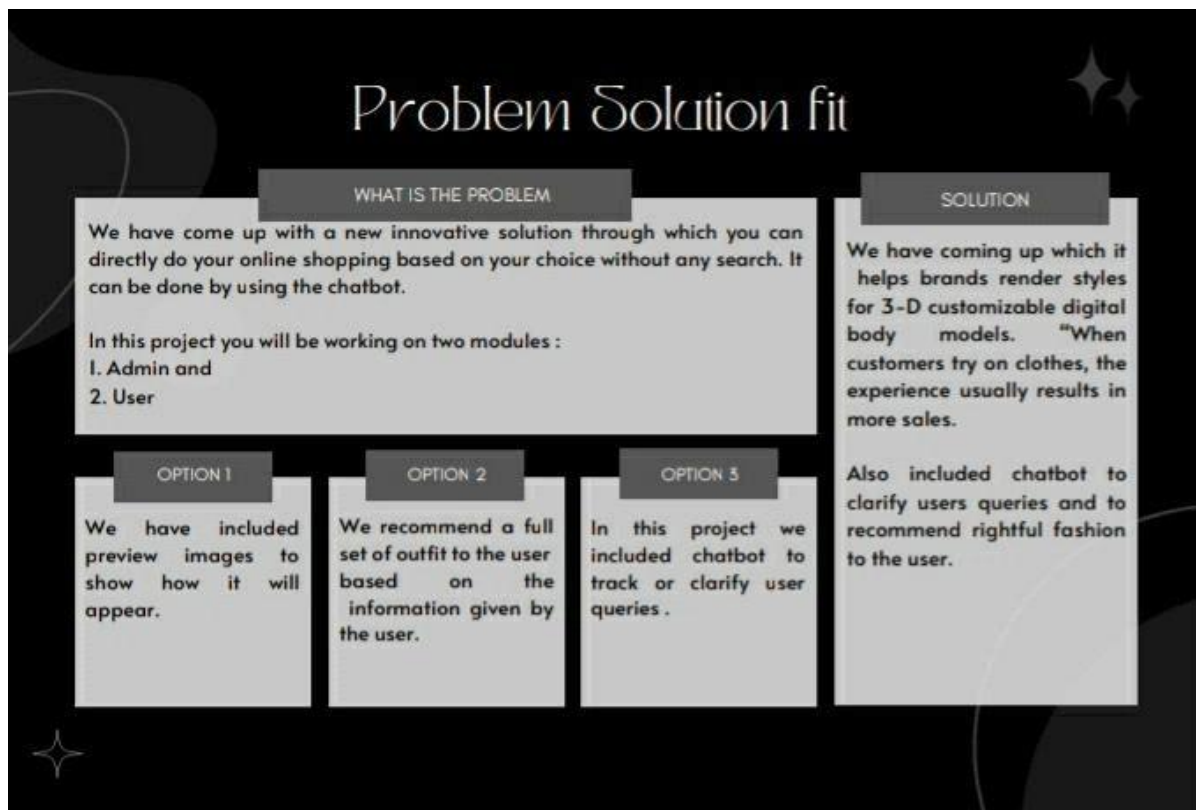

3.3 Proposed Solution:

S.N o	Parameter	Description
1.	Problem Statement (Problem to besolved)	Recommending trending fashion. Suggesting users matched fashions.
2.	Idea / Solution description	In this platform, there are numerous choices are available, an efficient recommendation system is required to

		<p>sort, order, and efficiently convey relevant product content or information to users.</p> <p>The chatbot can give recommendations to the users based on their interests. It can promote the best deals and offers on that day.</p>
3.	Novelty / Uniqueness	<p>Instead of navigating to several screens for booking products online, the user can directly talk to Chatbot regarding the products.</p> <p>Get the recommendations based on information provided by the user.</p> <p>Using chatbot we can manage user's choices and orders.</p>
4.	Social Impact / CustomerSatisfaction	User can see what is on trending.

		User will get updated on trending and exclusive offers.
5.	Business Model (RevenueModel)	<p>Revenue can be generated by selling the products and they can get offers on any occasions or upcoming festivals.</p> <p>The revenue can also be obtained by maintaining customers services when they needed, for that services it can be charged for it.</p>
6.	Scalability of the Solution	Through this, the user can get the right fashion to the right person.

3.4 Problem Solution Fit:

4. REQUIREMENT ANALYSIS

4.1 Functional Requirement:

FR No.	Functional Requirement(Epic)	Sub Requirement (Story / Sub-Task)

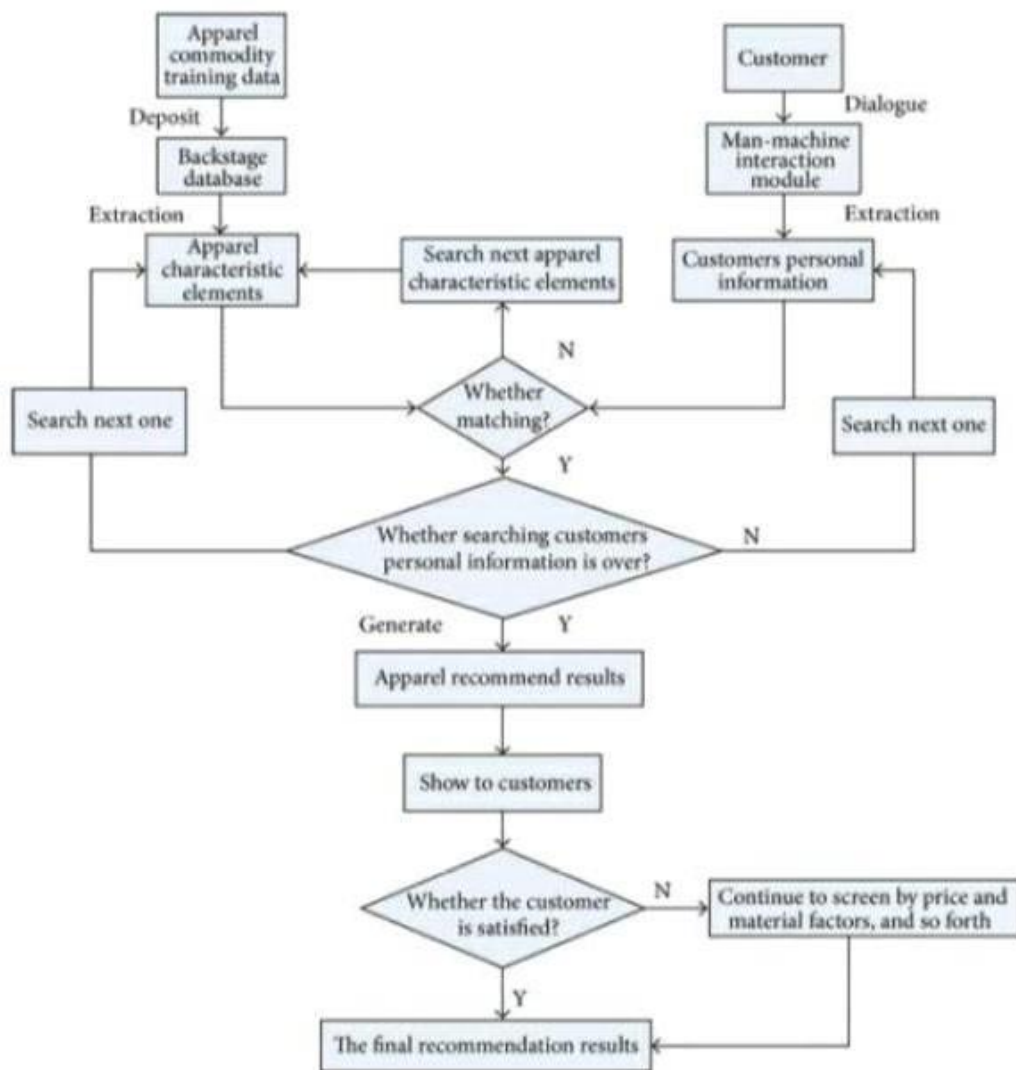

FR-1	User Registration	Registration through Form Registration through Gmail
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	Orders	As a user, can order the product through online shopping
FR-4	Chatbot	To finding the feelgood product by using automated chatbot
FR-5	Billing	Numerous payment option like google pay , amazon pay
FR-6	Data Management	Manage the data of weather conditions Manage the data of crop conditions Manage the data of live stock conditions

4.2 Non-Functional Requirement:

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Regardless of the size of your business, the website of your business should be easy to use for even a non-technical user
NFR-2	Security	This NFR deals with the security of the user data captured by the applications against any breach.
NFR-3	Reliability	It is also considered for the different admin roles by which you can control who can create , view, copy , change or delete information.
NFR-4	Performance	For increasing the traffic on your website , you have to give special attention to the performance.
NFR-5	Availability	Auto scaling, availability zones,Elastic load balancing.
NFR-6	Scalability	Scalability is a measure of a system being able to appropriately handle the increase/decrease in workload.

5.PROJECT DESIGN

5.1 Data Flow Diagram:

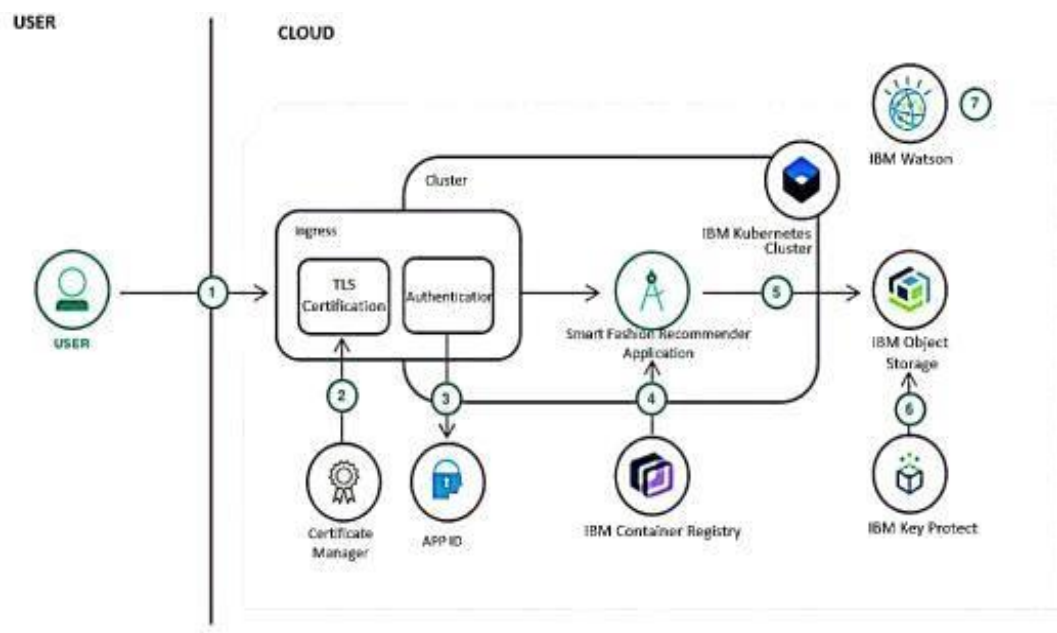

5.2 User Stories:

User Type	Functional Requirement	User Story Number	User Story / Task	Acceptance criteria	Priority	Release

	Requirement (Epic)					
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account /dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register for the application through Gmail		Medium	Sprint-1
	Login	USN-4	As a user, I can log into the application by entering email & password		High	Sprint-1
Customer (Web user)	Dashboard	USN-5	As a User can view the dashboard, and this dashboard include the check roles of access and then move to the manage modules.	I can view the dashboard in this smart farming application system.	High	Sprint 2
		USN-6	User can remotely	In the smart farming app	High	Sprint 3

			access the motor switch			
Administrator			As a user once view the manage modules this describes the Manage system Admins and Manage Roles of User and etc.			Sprint 2

5.3 Solution Architecture:

5.4 Technology Stack (Architecture & Stack):

Components & Technologies:

Component	Description	Technology
1. User Interface	User interaction with application e.g Web UI & Chatbot	HTML , CSS , Bootstrap , Javascript
2. Application Logic	Logic for a process in the application	Python- Flask
3. Email Service	For verify user and mail ads	SendGrid
4. Chatbot	Get details from user and store	IBM Watson Assistant
5. Cloud Database	Database Srvie on cloud	IBM DB2
6. Infrastructure	Application Deployment on Cloud system	Docker, Cloud Foundry , Kubernetes , etc.

Application Characteristics:

Component	Description	Technology
1. Open Source Frameworks	Used Web Technologies	HTML, CSS, JS, Python, Flask
2. Security Implementations	User verification through Email Service	SendGrid
3. Scalable Architecture	Run the app in Local and Cloud System	Docker and Kubernetes
4. Availabiilty	Justify the availability of application(e.g. use of load balancers , distributed servers etc.)	Docker and Kubernetes
5. Performance	Design consideration for the performance of the application etc.	IBM Cloud, Kubernetes Cluster, Container Registry

6.PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation:

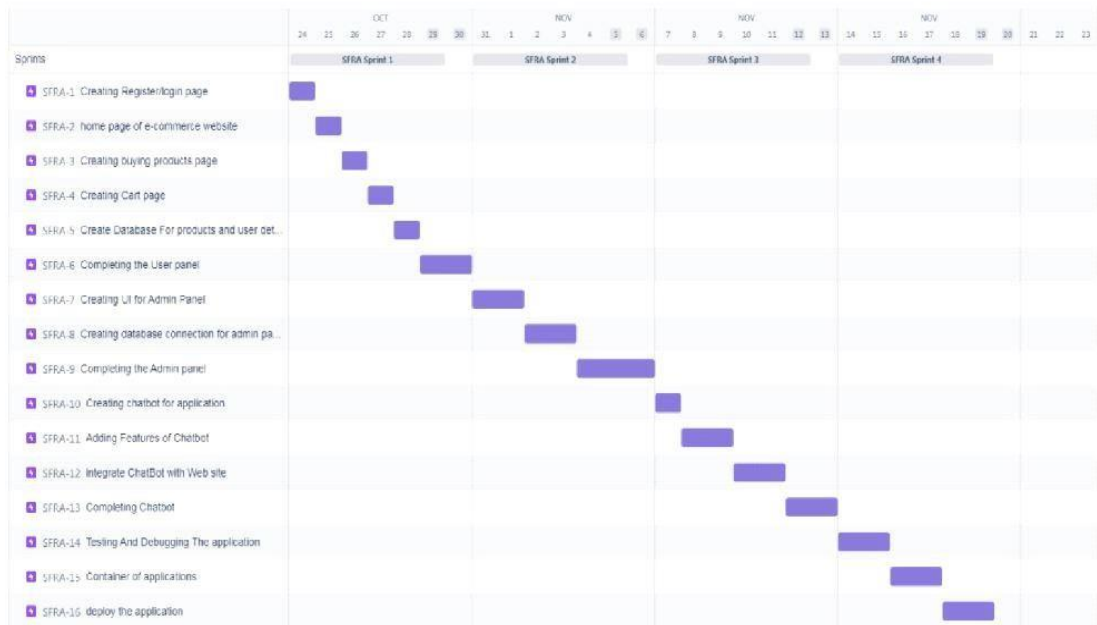

Sprint	Functional Requirement (Epic)	User Story Number	User Story/ Task	Story Points	Priority	TeamMembers
Sprint-1	AdminPanel	USN-1	As a Admin, <ul style="list-style-type: none">• Can login• Products- CRUD• User List• OrdersList	20	High	S ARCHANA J JANANI G JESSICA A KARUNYA SWEETLIN
Sprint-2	User Panel	USN-2	As a user, <ul style="list-style-type: none">• Register , Login , EmailVerification• ManualSearch• Order placement, OrderDetails	20	High	S ARCHANA J JANANI G JESSICA A KARUNYA SWEETLIN
Sprint-3	ChatBot	USN-3	<ul style="list-style-type: none">• Automatic product search based on user information• Can make order without any manual process	20	High	S ARCHANA J JANANI G JESSICA A KARUNYA SWEETLIN
Sprint-4	Testing & Deploy	USN-4	<ul style="list-style-type: none">• UnitTesting• Containerizethe app• Deploymentin IBM CLOUD	20	High	S ARCHANA J JANANI G JESSICA A KARUNYA SWEETLIN

6.2 Sprint Delivery Schedule:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

1	Smart Fashion Recommender Application	Manual		Worked as we expected		Use Laptop/ desktop Mode	No Defects

10 ADVANTAGES AND DISADVANTAGES

Advantages:

The proposed system shows that it can process the user's clothes from the images, identify the type and color of the outfit and finally recommend the most suitable outfit for the given occasion based on the user's existing clothes. The system provides a wardrobe, where users can store images of clothes that they have. Each user is associated with a wardrobe. We explore machine and deep learning techniques to classify the type of clothes from images and to identify the color of the clothes. Finally, we propose an algorithm that is used to recommend matching clothes.

Disadvantages:

The importance of a recommendation system has increased over the years and will continue owing to its various features. A recommendation system can help you improve your revenue by

suggesting the customer a perfect product or service; it can also help a business in marketing campaigns and track their customers. Needless to say, a recommendation system has smoothly become a part of the majority of digital stores and the SaaS industry. However, there are a few challenges that come along with a recommendation system, which are –

1.Lack of User Activity :

A recommendation system majorly depends on the activities performed by multiple users. It studies different users' behavior and then lists the products or services according to their activity and feedback. However, if many users buy the same product but do not leave any feedback or ratings, it becomes difficult for the recommendation system to recommend that particular product.

2.New Item Introduction :

When a new item is introduced on a website that is already using a recommendation system, it will not recommend it until and unless a user buys it. This shelves down the possibility of a good product coming into the limelight.

3.Changing Trends :

We all know-how in a blink of an eye, trends can change. One day it could be blue jeans that are trending, and one day suddenly, there is a trend of cargo pants. A recommendation system is accustomed to such a quick change in trend.

11 CONCLUSION

The Fashion Recommendation System is mainly used to recommend the best possible outfit combinations to a user who has no fashion sense based on their wardrobe . It may not always provide the best possible outfit to wear for an occasion as the system is dependent completely on the clothes present in the user's wardrobe. Also another reason is that fashion is highly dependent on the time period. However the system does a great job in inculcating a fashion sense among the users and can provide the best recommendations based on the user's wardrobe. Since the system is implemented as a website, it is very easy for the end users to access as well as use. The scope of this system can be expanded by including the ability to detect the various design and patterns on clothing, and to increase the number of occasions.

12 FUTURE SCOPE

In this section, we suggest some future research directions for fashion recommender systems. Considering the rapid growth of multimedia data, where visual information will be the critical component. More in-depth research in applications of multi-model fusion and multi-task learning in fashion recommender systems are required to model recommender system to be capable of profiling users comprehensively. Besides, while the majority of researches in fashion recommender systems is mainly based on similarity-based retrieval techniques, there is a need for more studies in the development of new functions such as designing clothes, which are highly demanded in future fashion recommender systems. Furthermore, most of the current fashion datasets do not contain outfit compatibility annotations, or they are limited in terms of size and the type of annotations they provide. Consequently, most researchers built their dataset, which is a labor-costing process, and most of them are not accessible publicly for further research. So, the other future direction for subsequent studies may be focusing on developing automatic annotation methods, constructing large-scale rich annotated data sets for particular task definitions in fashion recommender systems. From an ethical

perspective in fashion recommender systems also there is a need for performing the comprehensive study since it has not been studied in almost any of the researches, which have been reviewed through this thesis.
